                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain (amino CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC NS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate.

CC Mn-superoxide dismutase (MnSOD), MnSOD from Bacillus stearothermophilus, CC linker that can be cleaved by thrombin, translocation domain from CC diphtheria neurotoxin and a neuronal cell-specific binding domain from CC botulinum neurotoxin type F (BONT/F).

The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum CC chertoroxin translocation domain with botulinum concructs are neurotoxin type F (BONT/F) binding domain used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                The present sequence represents a construct of the invention, comprising a manganese superoxide dismutase (%n-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Manganese superoxide dismutase; Mn-SOD; SOD; neuronal cell; neuronal cell targeting component; NCTC; neuronal disease; oxidative stress; ischemic stroke; trauma; Parkinson's disease; Huntington's disease; motor neurone disease; botulinum neurotoxin serotype F.

The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleaveable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal chain. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, parkinson's disease, Huntington's disease and motor neurone disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                   CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with botulinum neurotoxin type F (BONT/F) binding domain used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New non toxic polypeptide for delivery of a therapeutic agreement of a CNS disorder comprising a binding domain the translocates the therapeutic agent into the neuronal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-DEC-1999; 99GB-0028530

The invention relates to movel vaccines that induce a protective immune CC response against botulinum neurotoxin (BNNT) serotypes A. B. C. D. E. F. CC and G. (BNNTA-BNOTG). The vaccine of the invention is movel recombinant CC flower comprising a C-terminal heavy chain fragment (Hc) from BNNT CC serotypes A.G. In preferred embodiments of the invention, the vector is CC a Venezuelan equine encephalitis virus (VEB) replicon vector. Use of CC this vector results in the production of large amounts of a protein CC encoded by a sequence cloned into the replicon. The constructs are used CC to produce vaccines against botulism. The proteins can also be used as CC diagnostic tools for the diagnosis of botulism. The transformed host CC enlis can be used to analyse the effectiveness of drugs and agents which CC inhibit toxin effects. The vaccine currently used against botulism is CC dangerous and expensive to produce, and contains formalin, which is very CC painful for the recipient. Also, the vaccine is incomplete, in that only CC vaccine of overcomes these problems, as it is easily purified, and CC available in large quantities. It is also expressed in the lymph nodes CC synthetic BONT Hc fragments used in the present on the CC encoding these sequences had been optimised for codon usage for expression in yeast. Note: This sequence is not given in the CC specification, but is decoded from the BONTF Hc DNA sequence given on CC cancer 45-46.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Botulinum neurotoxin; heavy chain; BoNT; serotype F;
C-terminal fragment; Venezuelan equine encephalitis virus replicon;
VEE; botulism; vaccine; diagnosis; drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  coli host cells, with the recombinant C fragment being purified on an affinity column. The invention relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant
            C-terminal fragment; Venezuelan equine encephalitis virus replicon; VEE; botulism; vaccine; diagnosis; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production vaccines and antitoxins that are useful in the treatment of P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of the histidine-tagged C fragmen of Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA sequence (see AAVJ0593) in plasmid pETHisb. This vector can be used to express BotC soluble C fragment in Escherichia

Cresponse against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F C and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant CC DNA construct comprising a vector, and at least one nucleic acid C fragment comprising a C-terminal heavy chain fragment (Hc) from BONT CC serotypes A-G. In preferred embodiments of the invention, the vector is CC a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of C this vector results in the production of large amounts of a protein CC encoded by a sequence cloned into the replicon. The constructs are used CC to produce vaccines against botulism. The proteins can also be used as C cells can be used to analyse the effectiveness of drugs and agents which CC inhibit toxin effects. The vaccine currently used against botulism is CC dangerous and expensive to produce, and contains formalin, which is very c paintful for the recipient. Also, the vaccine is incomplete, in that only C vaccine of overcomes these problems, as it is easily purified, and CC available in large quantities. It is also expressed in the lymph nodes CC for a better immune responses. Sequences AAY7134-Y7139 represent CC expression in vest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Clostridium botulinum Synthetic.

chain and then posttranslationally nicked, forming a dichain remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB04094 standard; Protein; 449 AA.

ENDOPEPTIDASE

I- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobravins, SNAP25 or syntaxin. No detected action on small molecule substrates.

I- SUBUNIT: DISULFIDE-LIMED HETERODIMER OF A LIGHT CHAIN (L) AND A HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, HEAVY CHAIN OCTIVITY, OF THE HEAVY CHAIN MEDIATE CHANNEL FORMATION AND TOXIN BINDING, RESPECTIVELY.

I- SUBCELLULAR LOCATION: Secreted.

I- MISCRLAUROUS: THERE ARE SEVEN ANTIGENICALLY DISTINCT FORMS OF BOTULINUM NEUROTOXIN: TYPES A, B, C1, D, E, F, AND G.

I- SIMILARITY: BELONGS TO DEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gimenez J., Foley J., Dasgupta B.R.;

"Neurotoxin type E from Clostridium botulinum and C. butyricum;

partial sequence and comparison.";

FASSEB J. 2:A1750-A1750(1998).

-i- FUNCTION: BOYULTUNUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ACT_SITE

                                                                                                                                        PHARMACEUTICAL: Available under the name BOTOX(R) (Allergan) for the treatment of strabismus and blepharospasm associated with dystonia and cervical dystonia. Also used for the treatment of hemifacial spasm and a number of other neurological disorders characterized by abnormal muscle contraction. MISCELLANEOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-1-Arg-198 bond in SNAP-25, thereby blockin neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CATALYTIC ACTIVITY: Limited hydrolysis of proteins
                                                                                                                                                                                                                                                                                                                                                  heavy chain (H).

gene encoding the nontoxic nonhemagglutinin component.;

Int. J. Syst. Bacteriol. 46:1105-1112(1996).

C. I- FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesticle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gh-1-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory failure (By similarity).

C. TATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobravins, SNAP25 or syntaxin. No detected action on small molecule substrates.

C. BUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H) (By similarity).

SUBCELLAUROUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl. D, E, F, and G.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.

BIOCHIM. BIOCHIMUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED

AND MOVES BY METROGRADE TRANSPORT UP THE XXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEL POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DISULFID

No detected action on small molecule substrates.
-!- SUBUNIT: DISULFIDE-LINKED HETERODIMER OF A LIGHT CHAIN (L) AND A HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, WHILE THE N-AND C-TEXHINAL OF THE HEAVY CHAIN MEDIATE CHANNEL FORMATION AND TOXIN BINDING, RESPECTIVELY.
-!- SUBCELULAR LOCATION: Secreted (By similarity).
-!- MISCELLAREOUS: THERE ARE SEVEN ANTIGENERCALLY DISTINCT FORMS OF BOTULINUM NEUROTOXIN: TYPES A, B, Cl, D, E, F, AND G.
                                                                                                                                                                                                Thermoplasma acidophilum.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce

The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from clostridium botulinum serotypes A-G.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant of recombinant nucleic acids are expressible in a recombinant of recombinant nucleic acids are expressible in a recombinant botulinum recombinant nucleic acids are expressible in a recombinant of recombinant nucleic acids are expressible to the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN) that translocates the therapeutic CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain of botulinum neurotoxin type F (FRANTEN with translocation Admain of Alentheberia neurotoxin type F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC substances to neurodegenerative diseases, stroke, epilepsy, brain tumours CC and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain which is a hybrid of botulinum neurotoxin type F (BONT) and tetanus neurotoxin (TeNT) domain II with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     translocates the therapeutic agent into the neuronal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New non toxic polypeptide for delivery of a therapeutic agent treatment of a CNS disorder comprising a binding domain that
                                               translocation domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2; Page 46; 50pp;

Polypeptides of the invention are CC cuseful for the treatment of a disease state associated with neuronal C cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC conjugate to neuronal cells. They are laso useful in gene therapy. The present sequence CC is modified clostridial heavy chain-superoxide dismutase conjugate. This CC conjugate comprises bacterial Mn-superoxide dismutase conjugate. This CC conjugate comprises bacterial Mn-superoxide dismutase conjugate. This CC conjugate bacterial form influenza virus and a neuronal cell-specific CC binding domain from botulinum neurotoxin type F (BoNT/F).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as Hc) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of CC alm domain of a clostridial toxin. Polypeptides of the invention are CC cells. The polypeptide constructs are useful for elivering therapeutic CC cubstances to neuronal cells. They are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC substances to neuronal cells. They are useful to treat disorders of the CC is including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence CC is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from CC modified clostridial heavy chain-superoxide dismutase (MnSOD), from CC constructs and a neuronal cell-cell-cell-cell-cell-domain from diphtheria neurotoxin and a neuronal cell-cell-cell-cell-domain from diphtheria neurotoxin and a neuronal cell-cell-cell-cell-cell-domain from diphtheria neurotoxin type F (BoNT/F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                            agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises a mitochondrial leader sequence from human Mn-superoxide dismutase (MnSOD), MnSOD from Bacillus stearothermophilus, linker that can be cleaved by thrombin, translocation domain from diphtheria neurotoxin and a neuronal cell-specific binding domain from botulinum neurotoxin type F (BONT/F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric - Homo sapiens.

                                                                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                   CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN) that translocates the therapeutic CC agent into the neuronal cell, where the translocation domain is not a HN CC domain of a clostridial neurotoxin and is not a fragment or derivative of CC a HN domain of a clostridial toxin. Polypeptides of the invention are CC cells. The polypeptide constructs are useful for delivering therapeutic cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC constitution. They are also useful in gene therapy, brain tumours and infection. They are also useful in gene therapy. The present sequence cc is C. botulinum C2 enterotoxin translocation domain with botulinum CC enterotoxin translocation domain with botulinum CC in the invention of the constructs.

                                                                                                                                                                                                                                                                                                                        The present sequence represents a construct of the invention, comprising a mandanese superoxide dismutase (Mn-SOD) polypeptide, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacillus stearothermophilus. Clostridium botulinum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Manganese superoxide dismutase; Mn-SOD; SOD; neuronal cell; neuronal cell targeting component; NCTC; neuronal disease; oxidative stress; ischemic stroke; trauma; Parkinson's disease; Huntington's disease; motor neurone disease; botulinum neurotoxin serotype F.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A manganese superoxide dismutase (Mn-SOD) construct

The present sequence represents a construct of the invention, comprisin a mitochondrial leader sequence from human manganese superoxide dismutase (Mn-SOD), a Bacillus stearothermophilus Mn-SOD, a linker that can be cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin serotype F. The specification describes a composition for delivery of SOD to neuronal cells. The composition comprises SOD linked, by a cleavable linker, to a neuronal cell targeting component (NCTC). This component has a domain that binds to a neuronal cell and a domain that translocates the SOD of the composition into the neuronal cell. After translocation, the linker is cleaved to release the SOD. The composition is useful for treating neuronal diseases caused or augmented by oxidative stress, such as schemic stroke, trauma, Parkinson's disease, Huntington's disease and motor neurone diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel composition, comprising superoxide dismutase linked by a cleavable linker to a neuronal cell targeting component useful for delivering superoxide dismutase to neuronal cells to treat ischemia -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A manganese superoxide dismutase (Mn-SOD) construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 57-60; 65pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens.
Bacillus stearothermophilus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neuronal cell targeting component; NCTC; neuronal disease; oxidative stress; ischemic stroke; trauma; Parkinson's disease;

                                                                                                                                                                                                               Š
                                                                                                                                                                                                                                                                                                                                                                                                                          CC The invention relates to a non toxic polypeptide, for delivery of a CC therapeutic agent to a neuronal cell, which comprises a binding domain CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated CC as HC) that binds to the neuronal cell and a translocation domain (amino CC terminal half of HC, designated as HN), that translocation domain is not a HN cC domain of a clostridial neurotoxin and is not a fragment or derivative of CC as HN domain of a clostridial neurotoxin and is not a fragment or derivative of CC useful for the treatment of a disease state associated with neuronal CC cells. The polypeptide constructs are useful for delivering therapeutic CC substances to neuronal cells. They are useful to treat disorders of the CC constinction. They are also useful in gene therapy. The present sequence CC is C. botulinum C2 enterotoxin translocation domain with botulinum CC neurotoxin type F (BONT/F) binding domain used in the exemplification of the constitution of the constitution of the invention of the constitution of the constitution of the constitution of the constitution of the invention of the constitution of the constitution of the constitution of the constitution of the invention of the constitution of the constitution of the constitution of the constitution of the invention of the constitution of the constitution of the constitution of the constitution of the invention of the constitution of t

The invention relates to novel vaccines that induce a protective immune CC cresponse against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F C and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant CC DNA construct comprising a vector, and at least one nucleic acid CC fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT CC serotypes A-G. In preferred embodiments of the invention, the vector is Serotypes A-G. In preferred embodiments of the invention, the vector use of this vector results in the production of large amounts of a protein cc this vector results in the production of large amounts of a protein cc encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as CC diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which CC inhibit toxin effects. The vaccine currently used against botulism is CC dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only contain the recipient of vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes of contain the commence had been privinged for rodon usage for the DNA contains the commence had been privinged for rodon usage for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QΥ
                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of the histidine-tagged C fragment C of Clostridium botulinum (202F strain) type F neuroboxin, encoded by a DNA sequence (see ANV3053) in plasmid pEFHisb. This vector can be used to express BotC soluble C fragment in Escharichia coli host cells, with the recombinant C fragment being purified on an affinity column. The invention relates to recombinant proteins certain derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant coxins are E. coll, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of waccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                                                                                                                        Query Match

-i- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CHAIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               InterPro; IPR000395; Bontoxilysin.

CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the catalytic activity: Lynaptobravins, SNAP25 or syntaxin. No detected action on small molecule substrates.

SUBUNIT: DISULFIDE-LINKED HETERODIMER OF A LIGHT CHAIN (L) AND A HEAVY CHAIN (H). THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, WHILE THE N-AND C-TERMINAL OF THE HEAVY CHAIN MEDIATE CHANNEL FORMATION AND TOXIN BINDING, RESPECTIVELY.

SUBCELLAURAL LOCATION: Secreted.
MISCELLAURACUG: THERE ARE SEVEN ANTIGENICALLY DISTINCT FORMS OF BOTULINUM NEUROTOXIN: TYPES A, B, C1, D, E, F, AND G.

SIMILARTY: BELONGS TO PEPTIDASE FAMILY M27.
